Motivation

Observation of single molecule orientation

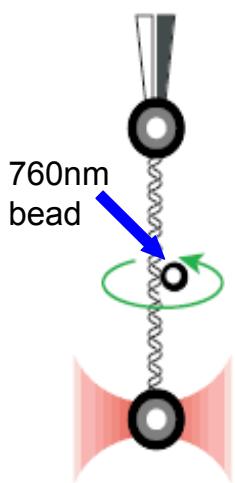

Nature 396, 279 (1998)

Jan Becker

DPG-Frühjahrstagung Dresden 2006

2

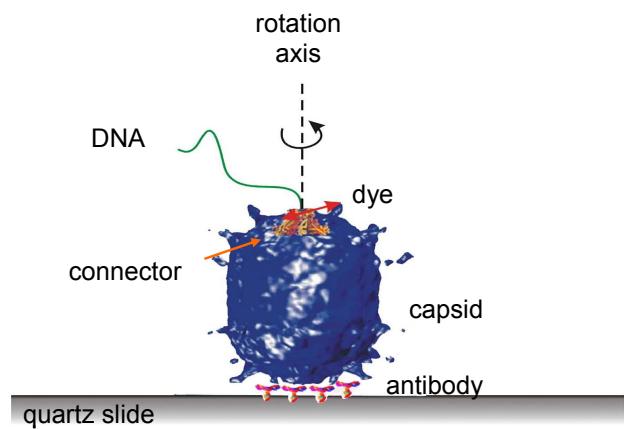

1. Lateral movement of beads 'localization'

Nature 424, 338-341 (y 2003)

But: large bead
=> large perturbation

2. Fluorescence polarization of single dyes

T.Hugel et al., unpublished

But: bleaching & blinking
=> only short time useable

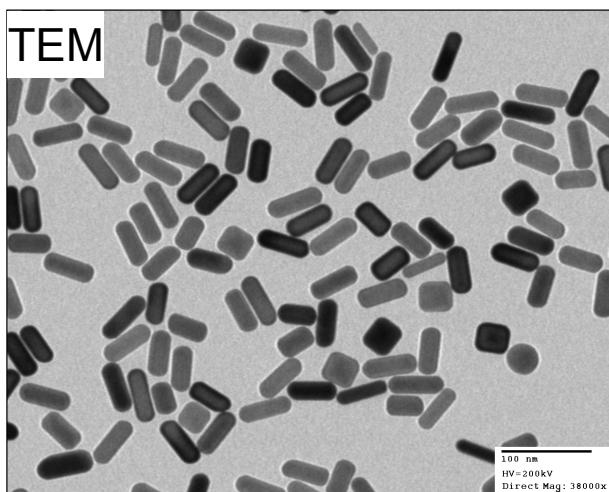

Jan Becker

DPG-Frühjahrstagung Dresden 2006

3

- Produced by chemical synthesis

TEM picture

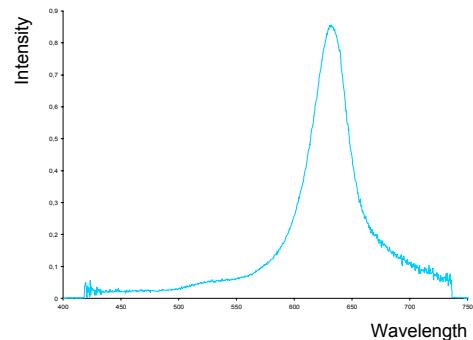

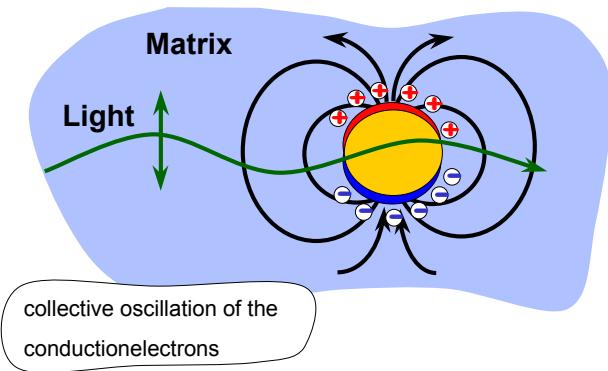

- Size: approximately 20x60 nm => less perturbation
- strong continuous signal

Jan Becker

DPG-Frühjahrstagung Dresden 2006

4

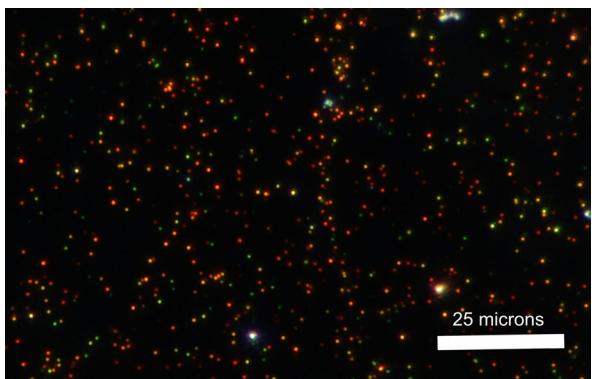

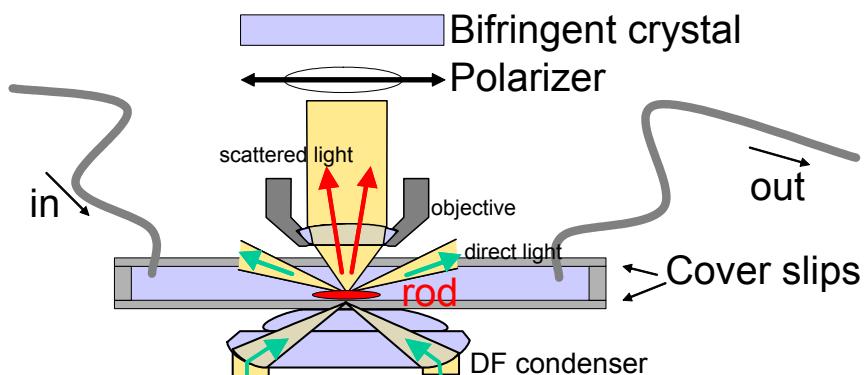

- At eigenfrequency of the collective e⁻ oscillation:
strong light scattering

- Rods scatter light polarized along the long axis

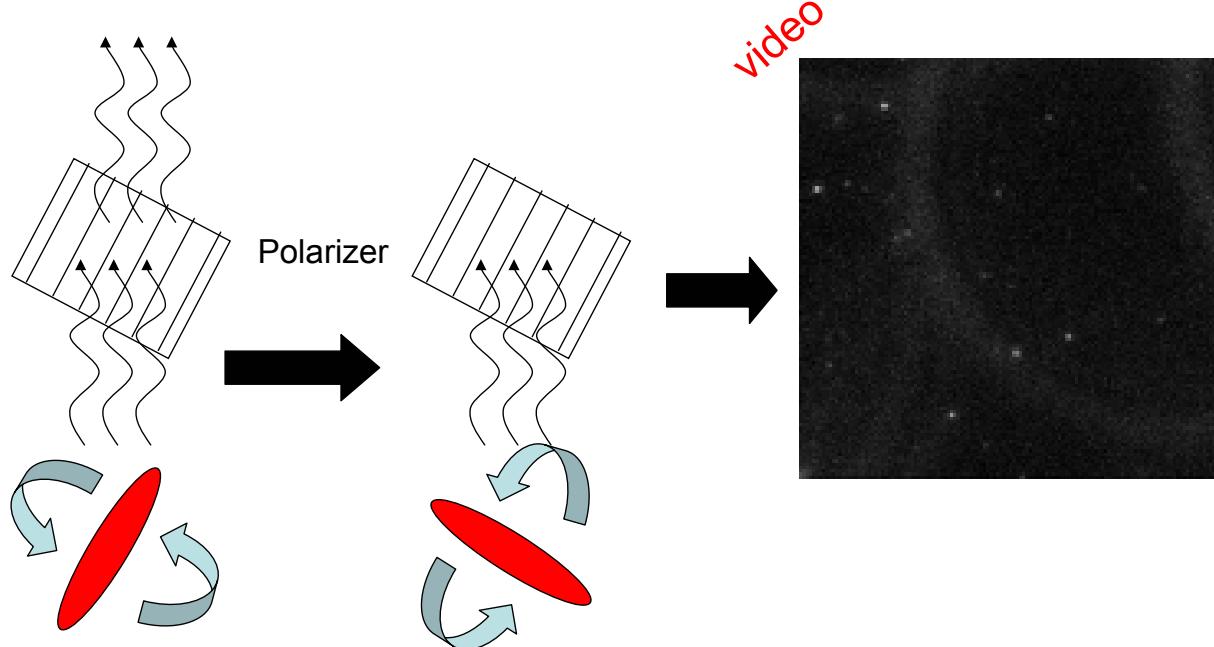

Dark-field Microscope

- True color picture
- Every dot is one particle
- The color (≡ resonance wavelength) depends on aspect-ratio, size and shape of the particle

- Polarization along the long axis => rotating particles ‘blink’ if a polarizer is used

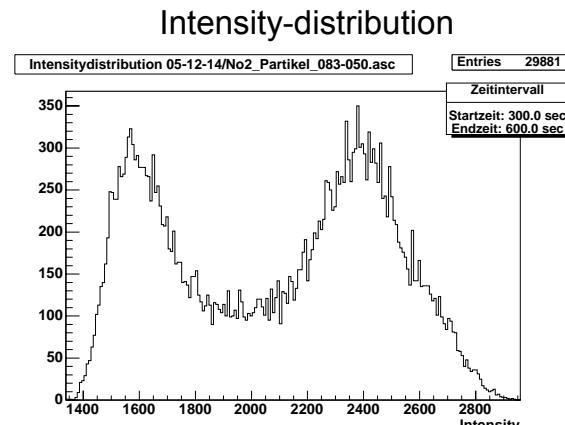

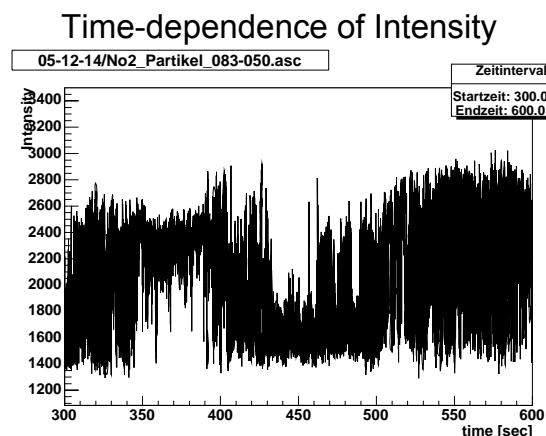

Jan Becker

DPG-Frühjahrstagung Dresden 2006

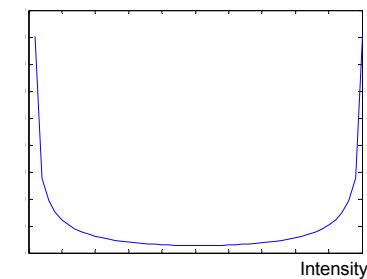

7

Analysis of a Rotating Particle

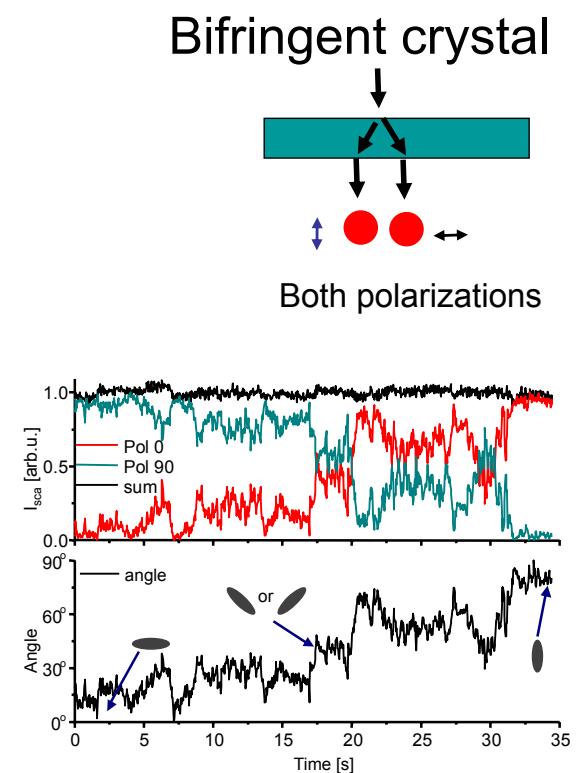

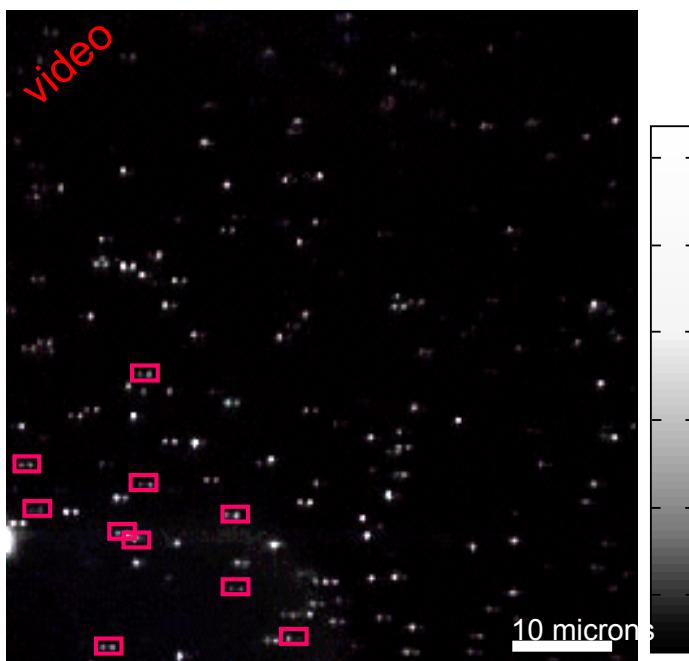

Ideal case

- Intensity $\sim \cos^2(\Theta)$
- If Θ is uniformly distributed

=> Measurement shows Brownian rotation

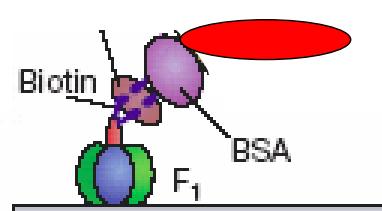

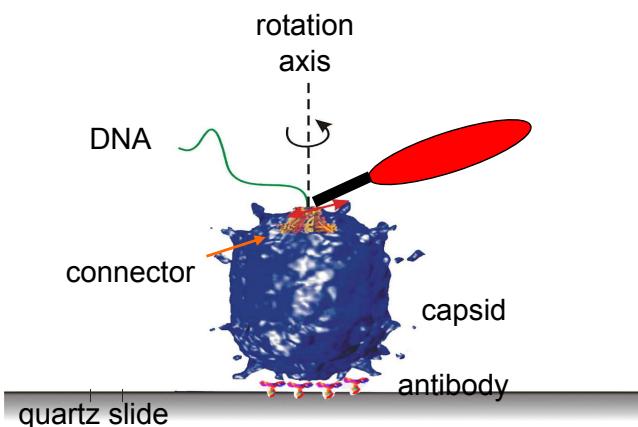

Jan Becker

DPG-Frühjahrstagung Dresden 2006

9

Future Work

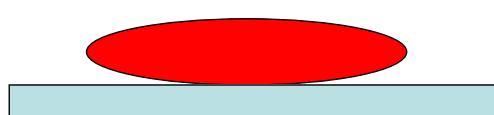

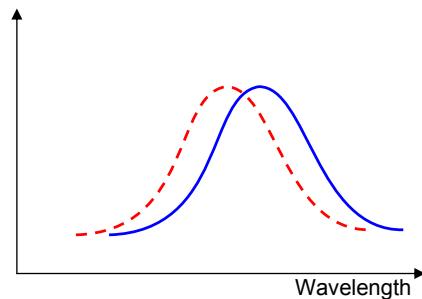

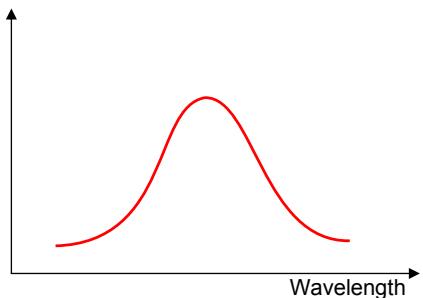

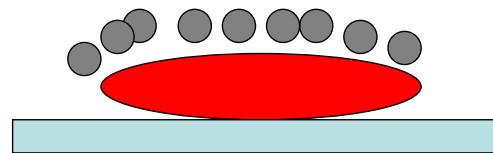

- Functionalization of rods
- Attachment of biomolecules
- Watch dynamics

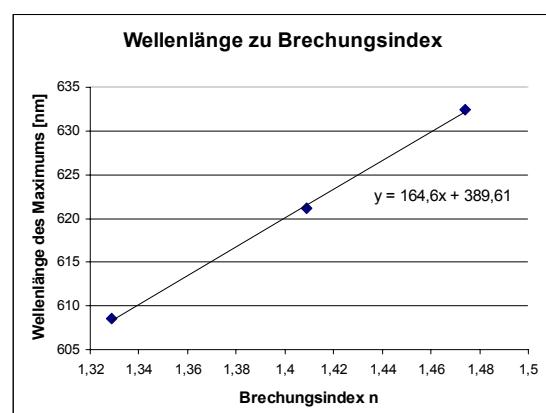

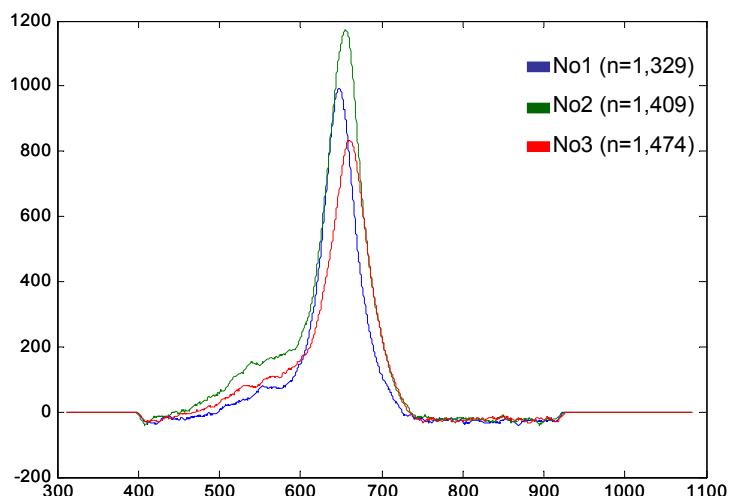

Jan Becker

DPG-Frühjahrstagung Dresden 2006

10

Refractive Index n_1 Refractive Index $n_2 > n_1$ 

=> Plasmon resonance wavelength shift

Linear Progression

=> Gold rods can be used as refractive index sensors
